Mill Brook Stream Bank Stabilization and Habitat Enhancement Project
September 2007

Temporary dam covered in plastic to allow work on east bank stabilization

Location of temporary dam
Left - Root wad and native tree stacking.

Below - Anchoring of root wads to boulders and or live native trees.
Boulder placement to encourage pool formation and slow velocity.

Temporary dam removed and feathering of stream bed

Rock vein with root wads packed around and behind.
Before

Feathering stream bottom

After
Seeding and Hay bare areas with winter rye
Boom for protection against possible oil/fuel leaks from equipment.

Access/entrance area blocked by boulders and six white pines.

Access road also stabilized with brush, winter rye and hay.
