# Why Restore Coastal Habitats?

- Resilience
  - the ability to recover from disturbance
- Healthy coastal habitats have the greatest resilience
- Restoring salt marshes will improve coastal resilience

# Climate Change

- Both Chronic and Acute Disturbance
  - Coastal Storms: increased frequency and intensity
  - Rainfall: extreme precipitation events
  - Temperature:
  - Relative Sea Level: 2 – 3 mm per year

# Why Restore Salt Marshes?

- Physical Resistance to Storm Surge
- Filtration of Freshwater Runoff
- Filtration of Sediments from Fresh or Marine
- Maintains Elevation at Mean Sea Level
- Unique Habitat for Many Plants and Animals
- Source of Energy for Coastal Food Webs
  - Nekton Trophic Relay

# Phrag Loves Lawns

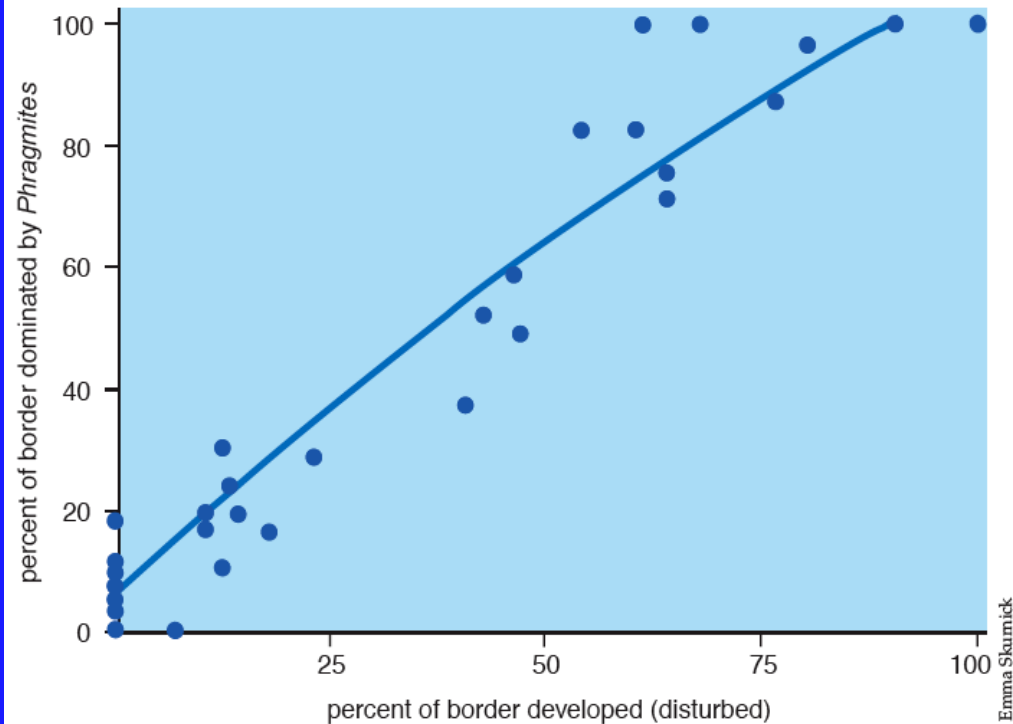

Figure 4. *Phragmites*, a reed, dominates some New England salt marshes. For thousands of years, *Phragmites* made up a small portion of the plants living along the terrestrial edge of New England salt marshes. When developers removed the woody vegetation along the terrestrial edges of marshes, more nitrogen-rich freshwater was allowed in. As a result, the soil's salinity dropped and nitrogen increased. Then, *Phragmites* started growing toward the saltwater. As shown here, a strong correlation exists between the percentage of a shoreline that is developed (horizontal axis) and the percentage of the marsh that gets dominated by *Phragmites* (vertical axis). Today, this reed dominates many salt marshes from Maine to the Chesapeake Bay.

## GOM Estuaries – 55 Species

FISH DIVERSITY		Fifty-five fish species have been documented in the salt marshes and estuaries at Wells National Estuarine Research Reserve in Wells, Maine.	
		<input type="checkbox"/> Abundant	<input type="checkbox"/> Common <input type="checkbox"/> Rare
Sea lamprey ( <i>Petromyzon marinus</i> )	Northern pipefish ( <i>Syngnathus fuscus</i> )		
American eel ( <i>Anguilla rostrata</i> )	Striped bass ( <i>Morone saxatilis</i> )		
Blueback herring ( <i>Alosa aestivalis</i> )	White perch ( <i>Morone americana</i> )		
Alewife ( <i>Alosa pseudoharengus</i> )	Bluefish ( <i>Pomatomus saltatrix</i> )		
American shad ( <i>Alosa sapidissima</i> )	Spotfin butterflyfish ( <i>Chaetodon ocellatus</i> )		
Atlantic menhaden (Pogy) ( <i>Brevoortia tyrannus</i> )	Cunner ( <i>Tautoglabrus adspersus</i> )		
Atlantic herring ( <i>Clupea harengus</i> )	Striped mullet ( <i>Mugil cephalus</i> )		
Atlantic salmon ( <i>Salmo salar</i> )	Northern sennet ( <i>Sphyraena borealis</i> )		
Brown trout ( <i>Salmo trutta</i> )	Snake blenny ( <i>Lumpenus lumpetateformis</i> )		
Brook trout ( <i>Salvelinus fontinalis</i> )	Radiated shanny ( <i>Ulvaria subbifurcata</i> )		
Atlantic cod ( <i>Gadus morhua</i> )	Rock gunnel ( <i>Pholis gunnellus</i> )		
Fourbeard rockling ( <i>Enchelyopus cimbrius</i> )	Sand lance ( <i>Ammodytes americanus</i> )		
Atlantic tomcod ( <i>Microgadus tomcod</i> )	Atlantic mackerel ( <i>Scomber scombrus</i> )		
White hake ( <i>Urophycis tenuis</i> )	Butterfish ( <i>Peprilus triacanthus</i> )		
Red hake ( <i>Urophycis chuss</i> )	Grubby sculpin ( <i>Myoxocephalus aeneus</i> )		
Pollock ( <i>Pollachius virens</i> )	Longhorn sculpin ( <i>Myoxocephalus octodecimspinosus</i> )		
Common mummichog ( <i>Fundulus heteroclitus</i> )	Slimy sculpin ( <i>Cottus cognatus</i> )		
Banded killifish ( <i>Fundulus diaphanous</i> )	Lumpfish ( <i>Cyclopterus lumpus</i> )		
Striped killifish ( <i>Fundulus majalis</i> )	Seasnail ( <i>Liparis atlanticus</i> )		
Atlantic silverside ( <i>Menidia menidia</i> )	Windowpane ( <i>Scopthalmus aquosus</i> )		
Inland silverside ( <i>Menidia beryllina</i> )	Winter flounder ( <i>Pseudopleuronectes americanus</i> )		
Fourspine stickleback ( <i>Apeltes quadracus</i> )	Golden shiner ( <i>Notemigonus crysoleucas</i> )		
Threespine stickleback ( <i>Gasterosteus aculeatus</i> )	White sucker ( <i>Catostomus commersoni</i> )		
Blackspotted stickleback ( <i>Gasterosteus wheatlandi</i> )	Pumpkinseed ( <i>Lepomis gibbosus</i> )		
Ninespine stickleback ( <i>Pungitius pungitius</i> )	Bluegill ( <i>Lepomis macrochirus</i> )		

# Nekton Trophic Relay

- Small fish stay in shallow water and eat smaller things
- Bigger fish stay in deep water and eat larger things, such as juvenile fish.
- The biggest fish live in deeper water and eat even larger things, such as adult fish.

# NEKTON TROPHIC RELAY MODEL (Kneib)

Wells National Estuarine Research  
Reserve

# Nekton Trophic Relay – Kneib 1997

1

On the marsh surface, dead plant matter is colonized by bacteria, fungi, and protozoans, making a rich food called detritus.

2

Small invertebrates living in the marsh consume detritus and other invertebrates. These may include crabs, amphipods, shrimp, and worms.

3

At high tide, mummichogs, silversides, and other small fish swim from the creeks onto the flooded marsh to feed on detritus and invertebrates.

4

Fished species such as striped bass and winter flounder eat small fish and invertebrates in the marsh and then leave the marsh, bringing nutrients to offshore food webs.

# Ways to Restore and Maintain Salt Marsh Habitat

- Restore/Maintain Natural Tidal Hydrology
- Restore/Maintain Natural Shorelands
- Restore/Maintain Natural Sediment Sources
- Provide for Habitat Migration

# Restoration Goal

- Produce self-sustaining ecosystem that closely resembles natural system in structure, function and values

# Restoring Marshes in the Gulf of Maine

- Hydrology – seems to be on the right track
- Small scale alterations – not clear
- Improvements in adjacent land use – need to be implemented

# How is the Patient Doing?

- Recovering Salt Marshes need Check-Ups
- Recovery requires improvement in ecological state over time - to expected level
- Recovery is measured by comparison to appropriate “healthy” examples called reference systems
- Recovery cannot be assumed – it must be evaluated
- Recovery often requires additional intervention

# Assessment Conclusions

- I. Sites selected for restoration activities are degraded relative to reference marshes for many ecological indicators.
- II. Regional restoration practices are successful at restoring physical functions of degraded marshes.
- III. Recovery of biologic functions is inconclusive, although plant communities trended toward reference states.
- IV. Response of biologic functions may be more variable and take longer than physical responses, continue monitoring.
- V. Differences in regional use of the protocol detract from regional assessment capabilities.
- VI. Progress toward increased regional acceptance would be facilitated by protocol refinements.

## Drakes Island Marsh

- 125 acre wetland partially restored in 1991
- Additional restoration action in 2005
  - Self Regulating Tide Gate (SRT)
- Manage tide gate for “natural” hydrology
  - Use % time under water as a measureable indicator
  - Requires accurate elevation surveys
  - Requires water level/elevation monitoring

### **GOMC-NOAA Habitat Restoration Grants Program**

In partnership with the NOAA National Marine Fisheries Service Community-based Restoration Program, the Gulf of Maine Council provides grants to support a strategic approach to marine, coastal, and riverine habitat restoration within Maine, Massachusetts, and New Hampshire. Non-government organizations, community associations, cooperatives, civic groups, municipalities, schools, and tribal and state governments are eligible to compete for funding made available through the GOMC-NOAA [Habitat Restoration Grants Program](#).
